SUMMARY OF THE 2014 FISH POPULATION STUDY

INTRODUCTION

To fulfill part of the continuing environmental monitoring requirements of the Prairie Island Nuclear Generating Plant, (PINGP), the Mississippi River fisheries population was sampled near Red Wing, Minnesota, May through October, 2014. The study area extends from 3.6 miles upstream of the plant (River mile 802) to 10.8 miles downstream of the plant (River mile 787.5), (Figure 1). The original objective of the study was to “determine existing ecological characteristics before plant operation and to assess any significant changes to the aquatic environment after operation” (NSP 1972). The objective was changed slightly after the plant became operational in 1973; to “determine environmental effects of the PINGP on the fish community in the Mississippi River and its backwaters” (Hawkinson 1973). Presently, the objective is to monitor and assess the status of the fishery in the vicinity of the PINGP (Mueller 1994). Parameters analyzed include species composition, length-weight regressions, length-frequency distributions, and catch per unit effort (CPUE). Starting in 2012, fish species, length and weights were entered into the Minnesota Department of Natural Resources (MNDNR) fisheries software program. The data was then downloaded into the MNDNR database. This annual report includes the Standard Lake Survey Reports created by the MNDNR (Attachment 1 and 2) for Mississippi River Pools 3 and 4. Pool 3 is a combination of sectors 1 and 2, while Pool 4 is a combination of sectors 3 and 4.

METHODS AND MATERIALS

Fish were collected using a Smith-Root SR-18 Electrofishing boat equipped with a 5.0 GPP electrofishing unit (Figure 6). The power source was a 5.0 GPP generator. The 5000 watt generator has a maximum output of 16 amps, and a range of 0-1000 volts. The generator has the capability to be either pulsed AC or DC with a pulse frequency of 7.5, 15, 30, 60, and 120 Hz. The anode consists of two umbrella arrays, each with six dropper cables. The 18 foot boat and dropper cables hung from the front of the boat serve as the cathode. Collection occurred during daylight hours with a pulsed direct current. Due to the constantly changing river conditions, Electrofisher output was varied to enhance the effectiveness.

Sampling was done monthly, May through October, within four established sectors of the study area (Figures 1-5). The runs within each sector are similar to previous years sampling to ensure a similar set of relative data indices. At the end of each “run”, the elapsed shocking time was recorded from a digital timer, which only tallied the seconds that the electrical field was energized. A run was terminated after approximately 450 seconds shocking time or when the end of the prescribed run was reached.

Stunned fish were captured with one-inch stretch mesh landing nets equipped with eight-foot insulated handles. Fish were placed in live-wells, supplied with river water constantly, until the end of each run. At the end of each run fish were identified, measured to the nearest millimeter (total length), weighed to the nearest 10 grams, and released. Parameters used to describe the fisheries include species composition, length-weight regressions, total numbers of each species collected, length-frequency distributions, and catch per unit effort (CPUE). It is assumed that population dynamics and spatial distribution is represented by CPUE.

Electrofishing CPUE was computed as numbers of fish per hour. Length frequency distributions are reported for all fish species. Length-weight relationships were calculated using the length-weight formula:

$$\log W = \log a + b \log L,$$

where W is the weight in grams, a is the y axis intercept, b is the slope of the regression line, and L is the total length in millimeters.

RESULTS

Initial PINGP preoperational annual environmental reports simply listed all data collected without discussion or analysis (NSP 1972). Individual species were not discussed, due to the amount of data collected during initial sampling efforts. This report will include, total number of each species, mean length and length range, CPUE comparison between Mississippi River Pools 3 and 4, length frequency distribution, and length weight regressions.

Electrofishing collection methods changed before the 1982 sampling season. The mesh size of the dip nets was increased to one inch stretch mesh. The larger mesh size enabled small adult fish and some young of the year fish of certain species to avoid collection. Currently, individual gizzard shad, freshwater drum, and white bass less than 160 mm are not collected. Also, logperch and cyprinids (other than carp) are no longer collected, due to their small size (Donkers 1987). Therefore, a direct comparison of electrofishing CPUE prior to 1982 is inappropriate to later years.

Species collected in 2014 are compared to previous years in Table 1. A total of 4,859 fish, comprising 41 species, was collected in the 2014 survey (Table 2).

All species collected in 2014 are ranked according to electrofishing CPUE and listed in Table 2. Table 3 lists the length-weight regressions calculated for each species.

All other parameters can be found in Attachments 1 and 2 (MNDNR Standard Lake Survey Report).

The top three abundant species, based on CPUE, was determined for each river pool (Table 2).

Pool 3;	freshwater drum, shorthead redhorse, carp
Pool 4;	freshwater drum, carp, white bass
Overall CPUE Average;	freshwater drum, carp, shorthead redhorse

DISCUSSION

When dealing with a large river environment, a high degree of natural variability exists in habitat conditions and therefore, in fish distribution. Palmquist (1982) proposed the wide range in species abundance between study areas was largely due to habitat preferences of a species rather than PINGP induced. Differences in collection efficiency and year class strengths may also explain this variability.

GENERAL

The ten most abundant species collected during 2014 in descending order, based on average CPUE for both pools combined were: 1) freshwater drum, 2) carp, 3) shorthead redhorse, 4) white bass, 5) smallmouth bass, 6) quillback, 7) largemouth bass, 8) sauger, 9) walleye, and 10) silver redhorse (Table 2).

Total average CPUE for all species and pools combined for 2014 was 107.85 fish/hour, a decrease from 2013 (133.66 fish/hr) (Table 2).

Survey Crew Notes

Ongoing monitoring of fish populations by Northern States Power (Xcel Energy) staff as part of Prairie Island Nuclear Generating Plant Monitoring Program

Field Notes - General Field

This sampling was conducted to fulfill part of the continuing environmental monitoring requirements of the Prairie Island Nuclear Generating Plant (PINGP), the Mississippi River fisheries population was sampled near Red Wing, Minnesota, May through October. The study area extends from 3.6 miles upstream of the plant (River Mile 802) to 10.8 miles downstream of the plant (River Mile 787.5). The original objective of the study was to "determine existing ecological characteristics before plant operation and to assess any significant changes to the aquatic environment after operation" (NSP 1972). The Objective was changed slightly after the plant became operational in 1973; to "determine environmental effects of the PINGP on the fish community in the Mississippi River and its backwaters" (Hawkinson 1973). Presently, the objective is to monitor and assess the status of the fishery in the vicinity of the PINGP (Mueller 1994). All included citations can be found in the "Prairie Island Nuclear Generating Plant Environmental Monitoring and Ecological Studies Program □ 2012 Annual Report" available in the Lake City Fisheries Office

STANDARD LAKE SURVEY REPORT

DRAFT VERSION - PRELIMINARY DATA (AS OF 02/13/2015)

Lake Name: U.S. Lock & Dam #4 Pool

Survey Type: External Management Survey

DOW Number: 79-0005-00

Survey ID Date: 05/01/2014

Lake Identification

Alternate Lake Name: N/A

DNR Sounding Map Number: N/A

Primary Lake Class ID:

Alternate Lake Class ID: N/A

Lake Location

Primary County: Wabasha

Nearest Town: Wabasha

Legal Descriptions

Lake Center: Township - 111N Range - 10W Section - 35

PLS Section Lake Center: 11101035

All Legal Descriptions:

Wabasha County: Township - 110N	Range - 10W	Sections - 1, 2, 3, 12
Township - 110N	Range - 9W	Sections - 7, 17, 18
Township - 111N	Range - 10W	Sections - 19, 20, 28, 29, 30, 32, 33, 34, 35
Township - 111N	Range - 11W	Sections - 13, 14, 23, 24

Area Office

Area Name: Lake City

ORG Code: F317

Region Name: Central

Region Number: 3

Lake Characteristics

Lake Area (planimetered acres): N/A

GIS Shoreline Length (miles): 49.52

GIS Lake Area (acres): 2612.35

Maximum Fetch (miles): N/A

DOW Lake Area (acres): 5660.00

Fetch Orientation (degrees): N/A

Littoral Area (acres): 0.00

USGS Quad Map Number: U22c

Area in MN (acres): 2612.34

USGS Quad 24K GIS Index: 4143

Maximum Depth (feet): N/A

Mean Depth (feet): N/A

Watershed Characteristics

Major Watershed

Name: Miss R-Winona

Minor Watershed

Watershed Number: 40

Name: Mississippi R

Watershed size (acres): 419,200

Watershed Number: 1

Watershed size (acres): 36,523

Surveys And Investigations

Population Assessment: 06/30/2014, 06/13/2011.

Survey Crew Notes

Ongoing monitoring of fish populations by Northern States Power (Xcel Energy) staff as part of Prairie Island Nuclear Generating Plant Monitoring Program

Field Notes - General Field

This sampling was conducted to fulfill part of the continuing environmental monitoring requirements of the Prairie Island Nuclear Generating Plant (PINGP), the Mississippi River fisheries population was sampled near Red Wing, Minnesota, May through October. The study area extends from 3.6 miles upstream of the plant (River Mile 802) to 10.8 miles downstream of the plant (River Mile 787.5). The original objective of the study was to "determine existing ecological characteristics before plant operation and to assess any significant changes to the aquatic environment after operation" (NSP 1972). The Objective was changed slightly after the plant became operational in 1973; to "determine environmental effects of the PINGP on the fish community in the Mississippi River and its backwaters" (Hawkinson 1973). Presently, the objective is to monitor and assess the status of the fishery in the vicinity of the PINGP (Mueller 1994). All included citations can be found in the "Prairie Island Nuclear Generating Plant Environmental Monitoring and Ecological Studies Program □ 2012 Annual Report" available in the Lake City Fisheries Office
